About KOMtech

1 Chairman’s Message

3 Editorial Note

5 An Integrated System for Improving Geotechnical Performance of Jackup Rig Installation
   A new instrumentation technology integrated with the Jackup to assist operators with decision making to avoid geotechnical hazards

19 Design of a DP2 Drillship Power Plant
   Load analyses with different operational modes are employed to evaluate the vessel power plant

31 Dedicated Cable Laying Vessels for Future Wind Farm Development
   KOMtech has developed two types of dedicated cable laying vessels for the demands of future wind farms

41 Numerical Simulation for Ship Side Launching
   Numerical Simulation of ship side launching using a CFD software coupled with a user defined program

47 CFD-based Resistance and Propulsion Prediction for Wind Turbine Installation
   Jackup Vessels and Semisubmersibles
   The high accuracy of the present CFD simulation is promising for the development of numerical towing tank techniques for efficient offshore and marine applications

59 Airgap and Wave Run-up Prediction for Semisubmersibles Using the CFD Simulation Approach
   An effective tool to predict the airgap and wave run-up response in extreme sea conditions

69 Nonlinear Control of an Active Heave Compensation System
   A nonlinear controller for the active heave compensation system is designed using backstepping technology

79 Ice-Induced Vibrations of Slender Offshore Structures
   A review of the current trends and challenges to understand the mechanism of ice-induced vibrations of slender offshore structures

87 A New Pipe Handling Approach for a Deepwater Slim Drillship
   A new pipe handling approach is developed to integrate with, and enhance, the operational capabilities of the slim drillship

97 Revisiting the Grouted Connection
   KOMtech has revisited the grouted connection for use in self installing platforms, wind turbine foundations and extendable draft semi connections
Editorial Note

This marks the third publication of our Technology Review. As with last year’s review, this publication highlights some continued research as well as some new research directions of KOMtech. Continuing areas of research include wind turbine installation vessels, the slim drillship, LNG systems and research into arctic structures. We are also pleased to have new papers on a diverse range of topics including cable laying vessels, control systems and a geotechnical investigation system designed to further enhance Keppel’s well established Jackup designs.

These papers present a snapshot of the ongoing work in KOMtech and are intended to stimulate further thoughts and innovations and to showcase some of the many competencies available and being developed in KOMtech. Every attempt has been made to ensure accurate and factual representation of the research presented, however it is important to note that much of this work is ongoing and represents the opinions and views of the authors and not necessarily an official position of KOMtech.

We have enhanced our collaboration with Keppel Business Units, Universities and Industry over the past year and their contribution to our research and to the papers presented in this publication are much appreciated. Technology Review is the result of many of hours of hard work from the authors and editors, and I would like to thank all involved for their hard work and support.

Michael Perry
Chairman, Editorial Committee

Editorial Committee:
Advisors: Mr Charles Foo and Dr Foo Kok Seng
Editorial members: Dr Michael Perry, Dr Ronald Chew, Dr Henry Krisdani, Mr Alex Tan, Mr Wayne Yap, Ms Sarah Pang and Ms Wong Chai Yueh (Group Corporate Communications)
