## SHALLOW WATER TECHNOLOGY

### 9 CFD Simulation-based Design and Optimization of Self-propelled Jackup and Semisubmersible Vessels

How CFD simulation plays an important role in the conceptual design stage for the design and optimization of self-propelled jackup and semisubmersible vessels.

---

### 25 Plug and Abandon JU

How a jack-up based on a standard hull and optimized topside equipment can be configured to be fit for efficient Plug & Abandon (P&A) operations and to provide decommissioning assistance.

---

### 35 Quantifying the Value of Flexibility in Oil and Gas Projects: A Case Study of Centralized Vs. Decentralized LNG Production Systems

The results of an analysis focusing on the evaluation of a large-scale oil and gas project under market uncertainty and flexibility in engineering design.

---

### 51 LNG Bunkering Constraints & Tangible Solutions

A study which identifies the constraints in the transfer of LNG for bunkering and also provides guidance for tangible solutions to designers on practical design improvements against conventional design issues encountered during operations.

---

### 57 Gas to Wire System: System Design, Economics and Dynamic Subsea Cables

A paper that proposes the extension of the Gas To Wire (GTW) concept for marginal and associated gas fields to include the use of gas from onshore shale gas and from LNG, by locating the power generation platform with different modules at inland rivers or near shore.

---

## 65 History of Keppel Power Barges and its Challenges

This paper describes Keppel's experience in construction of power barges by KFELS, the successful operation of the power barges by Keppel Energy and the technical challenges and considerations encountered.

---

## 75 An overview of the New ISO 19905-1 International Standard for Site-specific Assessment of Jackups and the Development of In-house Jackup Assessment Tools

With the recent development of the ISO19905-1 international standard, several key aspects of site assessments are described and discussed in this paper, along with an outline on in-house software and procedures for assessment that have also been developed.

---

## 83 Sequential and Integrated Analysis of the OWEC Quattropod®

The necessity of using integrated analyses in combination with a proper simulation tool to analyze the dynamic response of an offshore wind turbine(OWT) and obtaining a more accurate calculation of fatigue.

---

## 91 Design for Disassembly as a Method to Improve the Sustainability of Offshore Accommodations

Enhanced modularity and interior space flexibility, through the Design for Disassembly (DfD) principle, can effectively address the changing demands of mobile offshore units and the ever-changing national standards on offshore accommodation.

---

## 105 Towards a Circular Economy: Increasing Value Circulation and Reducing Environmental Impact

In the context of an unsustainable situation of ecosystem decline and material scarcity acknowledged worldwide, a transition towards a circular economy by means of equipment remanufacturing is seen as a possible vehicle towards a sustainable economy and society.

---

## DEEP WATER TECHNOLOGY

### 119 A Tool for Buckling Strength Screening and Assessment of Floating Offshore Structures

A software solution which is simple, reliable and sufficient for the evaluation of the buckling strength of the offshore structures.

---

### 125 Improved Semisubmersible Simplified Fatigue Screening Method Based On Field Scatters Data

A comparison of two simplified fatigue screening methods to propose an improved practice for semisubmersible fatigue assessment.

---

### 131 Feasibility of E-SEMI for Dry Tree Application in Deepwater

A feasible solution for dry tree application in deepwater drilling and production by means of an Extended-draft SEMI-submersible (E-SEMI).

---

### 139 Challenges and Potential of Extended Tension Leg Platform in Ultra-Deepwater

A state of the art review of ultra-deepwater Tension Leg Platforms (TLPs) and the challenges in hull design, global performance, tendon design and riser design.

---

### 147 LNG Fuelled Tug- An Alternative Fuel Powered Vessel

A harbor tug design that uses an alternative fuel source which is cleaner, greener and significantly cheaper than conventional fuel oil.

---

## SHIPYARD TECHNOLOGY

### 157 Keppel Carbon Footprint 2012

This paper presents and discusses the efforts made by Keppel to reduce and report its carbon emissions.

---
